- 16** Team Structure & Execution Timeline
- 17** Risks, Open Questions & Assumptions
- 18** Appendix — Glossary

PART A · FOUNDATION & STRATEGY

1. Executive Summary

YuGo is a hyperlocal commerce and delivery platform built to digitize and empower every neighbourhood business — not just supermarkets and large chains.

Unlike traditional quick-commerce platforms that primarily partner with large supermarket chains, YuGo's founding thesis is to onboard **every neighbourhood business** — grocers, vegetable and fruit vendors, licensed street food, stationery shops, bakeries, florists, hardware stores, electronics, gift shops, pet shops and licensed pharmacies — so customers can order from the shops that are actually nearby, while merchants get the tools to grow digitally.

The long-term vision is deliberately larger than delivery. YuGo is being built as the complete **operating system for local businesses**: online ordering, delivery management, billing & POS, inventory and stock management, customer management, business analytics, digital marketing, payment collection, and merchant growth tools — all on one platform.

What this document is

A single, consolidated Master PRD that merges the four module-level PRDs — Customer Platform, Shopkeeper Portal, Delivery Partner App, and Super Admin / Admin Portal — with the Business Model & Vision document and Brand Identity guide, so engineering, design and founders can build from one coherent source of truth.

How to use it

Part A sets shared context (vision, business model, roles, rollout). Parts B–E are the four buildable modules, each with its own detailed requirements, screens and workflow diagrams. Part F covers what only makes sense across all four apps at once — integration, revenue, tech, KPIs, team plan and risks.

1.1 The Four Connected Products

Product	Primary User	Core Job
Customer App	Shoppers	Discover nearby shops, order in minutes, track delivery live
Shopkeeper Portal	Merchants	List products, manage stock, accept & fulfil orders, run the business
Delivery Partner App	Riders (General & Merchant partners)	Accept assignments, navigate, pick up and deliver, track earnings
Super Admin / Admin Portal	Founding team & ops staff	Platform-wide control, verification, finance, region oversight, analytics

1.2 Document Scope

- ✓ Full functional requirements for all four applications, organized by module
- ✓ 11 workflow, architecture and state-machine diagrams built specifically for this document
- ✓ The consolidated business model, revenue streams, and platform-wide rollout plan
- ✓ Cross-app integration contracts — what each app promises the others
- ✓ Technology stack, non-functional requirements, KPIs, team plan, and open risks

2. Vision, Mission & Problem Statement

Vision

To build India's largest digital ecosystem for local businesses, enabling every neighbourhood shop to compete in the digital economy.

Mission

Empower millions of local businesses with technology that helps them sell online, manage operations, increase revenue, reach nearby customers, and grow sustainably — while giving customers a single platform to discover and order anything available nearby.

2.1 Problem Statement

Millions of local businesses still operate entirely offline. The challenges are structural, not incidental:

- Limited customer reach beyond walk-in footfall
- No digital presence or discoverability
- Poor inventory management
- Manual, error-prone billing
- No business analytics to guide decisions
- Inefficient or non-existent delivery capability
- Total dependence on walk-in customers

On the other side, customers face a fragmented experience — most of the shops actually closest to them are simply unavailable online. YuGo is built to close this gap on both sides at once.

2.2 Solution

YuGo provides a unified hyperlocal marketplace connecting customers with nearby businesses across categories, while giving every merchant the digital tools to run their business efficiently — turning a physical shop into a fully digital storefront without requiring separate billing or inventory software.

Supported categories at maturity: Grocery Stores · Vegetable Vendors · Fruit Shops · Street Food Vendors (licensed) · Restaurants · Stationery Shops · Bakeries · Florists · Hardware Shops · Electronics Stores · Gift Shops · Pet Shops · Pharmacies (licensed) · and any other neighbourhood business.

2.3 Long-Term Vision — Beyond Delivery

YuGo is not just a delivery app; it is building a complete ecosystem for local commerce. The future merchant platform extends to:

- ✓ Billing / POS System
- ✓ Inventory Management
- ✓ Stock Management
- ✓ Purchase Management
- ✓ Customer Database
- ✓ GST Reports
- ✓ Sales Reports
- ✓ Employee Management
- ✓ Delivery Management
- ✓ Loyalty Programs
- ✓ Digital Payments
- ✓ Marketing Dashboard
- ✓ Advertisement Platform
- ✓ AI-powered Business Insights

2.4 Competitive Advantage

- ✓ Supports every local business category, not just supermarkets
- ✓ Offers merchant self-delivery alongside platform delivery — merchants aren't forced onto one model
- ✓ Building long-term merchant software, not just a delivery app
- ✓ Empowers small businesses instead of replacing them
- ✓ Hyperlocal discovery focused on nearby communities
- ✓ Scalable regional operations through dedicated Region Heads

3. Business Model & Revenue Streams

Four revenue streams, designed to grow in sophistication as the platform matures from a delivery app into a full merchant operating system.

Stream	How it works
1. Merchant Commission	Commission or margin charged on every successful order.
2. Delivery Charges	Collected from customers based on distance, order value, and peak hours, plus an additional small-order fee for low-value purchases.
3. Merchant SaaS Subscription	Monthly subscription for premium business tools — billing, POS, inventory, stock management, reports, analytics, customer management, employee management.
4. Advertising Platform	Merchants pay to promote their store, products, discounts or festival campaigns via sponsored placements and banner advertisements.

Sequencing note: Commission and delivery charges are the Phase 0/1 revenue engine. SaaS subscription and the advertising marketplace are Phase 3 revenue layers, once merchant density and platform trust are established — see the diagram in Section 13 for how these streams combine into total platform revenue.

4. Platform Ecosystem & Architecture

YuGo is one shared backend expressed through four connected applications. No app is an island — every order, status change and location ping flows through a common Assignment Engine so all four surfaces stay in sync in real time.

Fig. 4.1 — YuGo ecosystem: four connected apps around one shared backend

App	Platforms	Talks to backend for
Customer App	Responsive Web, Android, iOS	Placing orders, live tracking, payments, ratings
Shopkeeper Portal	React web dashboard + React Native companion app	Catalogue, inventory, order queue, delivery mode, payouts
Delivery Partner App	Android & iOS (React Native)	Assignment, navigation, status updates, earnings ledger
Super Admin / Admin Portal	Web dashboard, RBAC-gated	Verification, finance, region oversight, configuration, analytics

A full breakdown of exactly which events each app sends and receives is covered in Section 12 — Cross-App Integration & Data Flow.

5. User Roles & Permissions

Six roles span the platform, from the founding team down to the customer placing an order. Permissions narrow as you move down the hierarchy; regional scope narrows as you move across it.

Fig. 5.1 — YuGo role hierarchy and platform relationships

5.1 Role Definitions

Super Admin

The founding team, with complete platform control: platform management, financial reports, user management, merchant approvals, region management, analytics, and access to all data.

Admin

Operations and support team, with permissions limited by Role-Based Access Control (RBAC). Responsibilities include customer support, merchant support, order resolution, refund management, delivery monitoring, and user verification. Admins **cannot** access sensitive configuration such as revenue settings, tax configuration, the delivery pricing engine, platform charges, system settings, audit logs, or permission management itself — those remain Super Admin-only.

Region Head

Each geographical region has a dedicated manager responsible for merchant onboarding, merchant relationship management, delivery operations, local marketing, customer issue escalation, and regional performance monitoring.

Shopkeeper (Merchant)

Business owners selling products through YuGo. Capabilities: manage products, accept orders, manage inventory, choose delivery method (self-delivery or YuGo Delivery Partner), view reports, run advertisements, manage employees, and access a real-time business dashboard.

Customer

Platform users purchasing products. Capabilities: search nearby stores, compare products, track orders, pay online, rate and review, reorder, maintain a wishlist, and access offers and rewards.

Delivery Partner

Delivery personnel working either independently for YuGo (**General Partner**) or for a specific merchant (**Merchant Partner**). Responsibilities: pick-up, delivery, earnings tracking, route navigation, and order status updates.

Employees / Staff: Shopkeepers can additionally create limited sub-logins for their own staff (e.g. order handling only, no financial access) — these are scoped entirely within a single shop's account, not a platform-wide role.

6. Brand Identity Snapshot

Every screen across all four apps should read as unmistakably YuGo. The identity is technology-first, minimal and timeless — built around deep dark surfaces, electric aqua, and subtle violet accents, matching the vision of becoming an operating system, not just another delivery app.

6.1 Brand Personality

Modern Clean and minimal	Intelligent Built for technology	Trustworthy Reliable for merchants
Fast Smooth and responsive	Friendly Rounded geometry	Premium Dark-first design, scalable to future SaaS products

6.2 Colour System

Role	Name	Hex	Usage
Primary	Electric Aqua	#30F2C2	Logo, primary buttons, active navigation, links, icons, CTAs
Secondary	Sky Cyan	#6BE8FF	Hover states, secondary buttons, cards, illustrations, graphs
Premium	Electric Violet	#7A5AF8	AI, premium features, Merchant Pro, analytics, dashboard highlights (use sparingly)
Success	—	#2ED573	Confirmations, positive states
Warning	—	#FFB84D	Caution states
Error	—	#FF5D73	Errors, destructive actions

Dark Theme (default app surface)

Background	#090C14
Secondary background	#111827
Surface	#141A24
Elevated (cards / dialogs)	#1B2433
Border	#283447

Light Theme (documents / web)

Background	#F6F8FB
Surface	FFFFFF
Border	#DCE5EE
Text primary	#101828
Text secondary	#4F5F75

6.3 Typography

Purpose	Font	Weight	Size
---------	------	--------	------

Logo / Display	Space Grotesk	700	Custom / 56–72px
H1 – H2	Space Grotesk	700	40–48px
H3 – H6	Space Grotesk	600	20–32px
Body	Inter	400 / 500	14–18px
Caption / Overline	Inter	400 / 500	11–12px

Full token set (gradients, component color mapping, CSS variables) lives in the standalone YuGo Brand Identity v1.0 guide — this section is a build-ready summary for reference while implementing screens across all four apps.

7. Go-to-Market & Rollout Plan

YuGo launches deliberately narrow and expands in three controlled phases after an internal pilot — every module PRD in this document maps its own feature scope to these same phases.

Fig. 7.1 — Business rollout timeline, Phase 0 through Phase 3

7.1 Phase Detail

Phase 0 — Pilot Launch Target: 1 October

Objective: validate operations with a controlled pilot before public expansion. **Scope:** a single PIN code, a limited set of merchants and customers, internal testing, feedback collection, delivery-process validation and app-stability testing. **Primary goal:** reliable operations before going public.

Phase 1 — Initial Market Launch Target: 1 January

Coverage: 5–10 PIN codes. **Business model:** single-store orders only. **Supported categories:** Grocery, licensed Street Food, Stationery, General/Local Stores. **Excluded initially:** pharmacies and unlicensed food vendors — both need compliance workflows built for a later phase.

Key features: Customer App, Merchant Dashboard, basic inventory management, order management, merchant self-delivery, and the YuGo delivery option.

Primary challenge: inventory synchronization for merchants already running their own billing or POS system. YuGo should support integrating with what a shop already has, rather than forcing an immediate migration.

Phase 2 — Marketplace Expansion

- ✓ Multi-store orders in a single delivery
- ✓ Optimized delivery routing
- ✓ Licensed street-food onboarding at scale
- ✓ Increased merchant categories and enhanced merchant tools
- ✓ Delivery partner network expansion

Phase 3 — Scale Across Cities

- ✓ City-wide expansion across multiple regions

- ✓ Thousands of merchants; advanced logistics
- ✓ AI recommendations and demand prediction
- ✓ Merchant SaaS platform and advertisement marketplace
- ✓ The complete business operating system vision realized

PART B · CUSTOMER PLATFORM

8. Customer Platform PRD

MODULE

Customer Web & Mobile Platform

YuGo is a hyperlocal quick-commerce platform that lets customers discover, purchase and receive groceries, daily essentials, medicines and household products in minutes.

8.1 Product Vision & Objectives

Vision: build India's most trusted quick-commerce experience by combining fast delivery, intuitive shopping, transparent pricing, real-time tracking, and AI-driven personalization.

- ✓ Reduce friction throughout the shopping journey
- ✓ Enable checkout in under 30 seconds
- ✓ Provide real-time order visibility
- ✓ Increase customer retention through rewards and personalization
- ✓ Support scalable growth across cities

8.2 Target Users

User	Description
Guest Users	Browse products before login
Regular Customers	Daily grocery shoppers
Returning Customers	Frequent buyers using reorder and recommendations
Premium Members (Future)	Receive exclusive benefits
Corporate Customers (Future)	Bulk and scheduled orders

8.3 Supported Platforms

Responsive website, Android app, iOS app — with a PWA and voice-assistant integration planned for the future.

8.4 Customer Journey

Fig. 8.1 — End-to-end customer journey, launch to reorder

8.5 Authentication & Onboarding

- ✓ Guest browsing supported before any login is required
- ✓ Login via OTP; future support for Google, Email and Apple sign-in
- ✓ OTP verification with a resend timer
- ✓ Profile setup and permission management
- ✓ Location selection is mandatory before shopping begins

8.6 Home Dashboard

- ✓ Delivery location selector
- ✓ Universal search bar
- ✓ Banner carousel for promotions
- ✓ Category grid (Groceries, Dairy, Fruits, Medicines, etc.)
- ✓ Recommended products, Buy Again, Nearby Stores, Flash Deals
- ✓ Quick actions: Wallet, Coupons, Track Order, Wishlist

8.7 Product Discovery

- ✓ Instant search suggestions
- ✓ Advanced filters — price, rating, availability, delivery time
- ✓ Sorting by relevance, popularity, price, rating
- ✓ Detailed product pages with nutrition, ingredients and reviews
- ✓ Wishlist and Smart Compare feature

AI roadmap: voice search, image search, and recipe-to-cart are planned future enhancements to discovery.

8.8 Cart & Checkout

- ✓ Dynamic cart with quantity controls
- ✓ Transparent pricing: MRP, discounts, delivery fee, taxes shown line by line
- ✓ Coupon engine with automatic best-coupon suggestion
- ✓ Saved addresses and delivery instructions
- ✓ UPI, cards, wallets and Cash on Delivery
- ✓ Smart Cart recommendations based on purchase history

8.9 Order Management & Live Tracking

- ✓ Live order timeline from placement to delivery
- ✓ Map-based delivery tracking with ETA

- ✓ Delivery partner details and in-app communication
- ✓ Push, SMS and email notifications at every status change
- ✓ Issue reporting for missing, damaged or delayed orders

This tracking view is powered directly by the Delivery Partner App's location-ping stream — see Section 12 for the exact event contract.

8.10 Customer Account

- ✓ Profile management
- ✓ Order history and one-tap reorder
- ✓ Wishlist, wallet and coupons
- ✓ Refer & Earn
- ✓ Saved addresses, settings and support
- ✓ YuGo Insights dashboard for personal spending and savings

8.11 System Requirements & Business Rules

Requirement	Target
Home screen load time	Within 2 seconds
Search response time	Within 1 second
Platform availability	99.9% target uptime
Security	HTTPS, encrypted communication, secure payment gateway, OTP authentication, secure session management
Scalability	Architecture supporting millions of users
Analytics tracked	DAU, MAU, AOV, checkout conversion, retention

8.12 Product Roadmap

Phase	Focus
Phase 1 — MVP	Core shopping, checkout, payments, tracking, support
Phase 2 — Growth	Wallet, loyalty, referrals, scheduled delivery, personalization
Phase 3 — Intelligence	AI assistant, predictive reorder, smart pantry, conversational search

8.13 Wireframe Reference

Design and engineering should scope initial wireframes for: Authentication Flow, Home Dashboard, Product Details, Cart & Checkout, Live Tracking, and the Customer Account Dashboard — in that priority order, matching the Phase 1 MVP scope above.

PART C · SHOPKEEPER PORTAL

9. Shopkeeper Portal PRD

MODULE

Merchant-Facing Storefront & Operations Console

Lets a shop owner list products, track stock, accept and fulfil orders, and understand their business — without needing any separate billing or inventory software. For most merchants, this portal will be the first piece of business software they have ever used.

9.1 Business Objectives

- ✓ **Fast onboarding** — a shop should reach "Under Review" in under 10 minutes
- ✓ **Zero-friction digitisation** — manual entry, Excel/CSV bulk import, and barcode scanning must all work against the same catalogue
- ✓ **Full order transparency** — every order status, bill and delivery update visible in real time
- ✓ **Delivery flexibility** — a shop can fulfil with its own staff or hand off to a YuGo delivery partner, order by order
- ✓ **Actionable insight** — a dashboard that answers "is my shop doing well today" at a glance

9.2 Rollout Scope by Phase

Phase	Timeline	Store Model	Categories Supported
Phase 0 — Pilot	1 Oct	Single PIN code, limited merchants, internal testing only	All Phase 1 categories, curated list
Phase 1 — Initial Launch	1 Jan	Single-store orders only, 5–10 PIN codes	Grocery, Street Food (licensed only), Stationery, General/Local Stores
Phase 2 — Marketplace Expansion	—	Multi-store orders per delivery	+ Licensed street-food expansion, more local categories
Phase 3 — Scale	—	City-wide, multi-region	Full category set + Merchant SaaS tools

Excluded at launch: pharmacies and unlicensed street-food vendors — both require compliance workflows planned for a later phase. A known open challenge is stock synchronisation for merchants who already run their own billing/POS system; the portal should support integrating with what a shop already has rather than forcing an immediate migration.

9.3 Shopkeeper Role & Capabilities

Capability	What it means for the shop
Manage products	Add, edit, price and photograph the catalogue
Accept orders	Approve or reject incoming orders within a timer
Manage inventory	Keep live stock counts accurate across sales channels

Choose delivery method	Self-delivery with own staff, or hand off to a YuGo delivery partner
View reports	Revenue, order and stock reports, exportable
Run advertisements	Promote the store, products, discounts or festival offers
Manage employees	Add staff logins with limited permissions
Access business dashboard	Real-time KPIs and trend graphs

9.4 Feature Map

Rather than a flat feature list, the portal is best understood as nine connected modules around one core job: turning a physical shop into a store the Assignment Engine can reliably route orders to.

- Dashboard (Home)
 - Product & Catalog
 - Inventory & Stock
- Order Management
 - Delivery Management
 - Billing & POS
- Discounts & Marketing
 - Reports & Dashboard
 - Employees & Settings

9.5 Onboarding & Verification Flow

Onboarding has to be strict enough to keep out unlicensed or fraudulent shops, while staying fast enough that a shop owner doesn't give up halfway through.

Fig. 9.1 — Shopkeeper onboarding & verification flow

9.5.1 Registration Details Collected

Field	Notes
Company / Shop Name	Locked after verification — contact support to change
GST Number	Locked after verification; validated via OCR + government lookup
Self-Delivery Capability	Yes/No — editable any time from Settings
Xerox / Printing Service	Yes/No — editable any time from Settings
Shop Timings & Break Time	Open/close time per day, editable
Contact Details	Mobile number, email ID
Shop Images	Storefront + interior, editable any time
Shop Location & Address	Pin dropped on map, used for delivery radius

9.5.2 Verification & Rejection Handling

- ✓ Region Head / Admin reviews GST and submitted documents against government records
- ✓ A rejected document returns a specific reason (e.g. "blurry image", "GST mismatch") — the shop only re-uploads the flagged item, not the full application
- ✓ Once approved, the dashboard unlocks immediately and the shop receives a welcome notification

9.6 Core Screens & Modules

9.6.1 Dashboard (Home)

The first screen a shopkeeper sees after logging in — a snapshot of how the shop is doing right now.

- ✓ KPI cards: Today's Revenue, Orders Today, Live Orders, Total Products, Low-Stock Items, Average Rating
- ✓ Charts: Revenue trend, Orders by hour, Category-wise sales split
- ✓ Quick actions: toggle shop Online/Offline, jump to new order queue

9.6.2 Product & Catalog Management

Every product on the shelf becomes a product card in the app — this module is where that card is built and kept accurate.

Fields captured on add/edit

- Product name, category, one or more photos
- Price, discount %, resulting final price (original struck through)
- Stock quantity, date of purchase, expiry date
- Short description, barcode/SKU, availability toggle

Bulk actions

- Add many products at once via Excel or CSV import
- Import directly from a shop's existing billing/POS database where an integration exists

Customer-facing card shows

Image, name, short description, discount badge, final price with original struck through, in-stock indicator, rating, add-to-cart button, and a marker if the customer has ordered it before.

9.6.3 Inventory & Stock Management

Stock has to stay accurate across three very different input methods without the shopkeeper doing extra work.

- ✓ **Barcode scanning:** scan a product to flip it between online and offline POS status in real time — useful when an item sells out at the counter before the app catches up
- ✓ **Low-stock alerts:** shopkeeper sets a threshold quantity per product; the dashboard flags anything below it
- ✓ **Auto out-of-stock:** a product hits zero stock and is instantly hidden from the Customer App — no manual step needed
- ✓ **Expiry tracking:** products nearing their expiry date (captured at creation) are flagged on the dashboard
- ✓ **Reports:** stock and sales history downloadable as CSV or Excel at any time

9.6.4 Order Management

Every order moves through the same lifecycle, whether it is picked up by the shop's own rider or a YuGo delivery partner.

Fig. 9.2 — Order lifecycle state machine (shared with the Delivery Partner App)

Order queue screen

- Tabs for New, Preparing, Ready for Pickup, Out for Delivery, Completed and Cancelled
- A new order shows a push alert with sound and a countdown timer to accept or reject

Order detail screen

- Items ordered, bill breakup, payment method, delivery partner assigned, full status timeline
- Order details downloadable in CSV or Excel
- Manual status update where the flow requires it (e.g. "Out for Delivery" on self-delivery orders)

9.6.5 Delivery Management

A shop is never locked into one delivery model — it can use its own staff, YuGo's delivery network, or switch between the two per order.

Fig. 9.3 — Delivery mode decision flow

Self-delivery

- Shop maintains its own roster of delivery staff inside the portal
- A specific staff member is assigned per order; that person updates status as they move
- Order marked Delivered once the customer's OTP is entered

YuGo Delivery Partner

- The Assignment Engine finds the nearest available partner automatically
- Shop and customer can both see the partner's live location until drop-off
- If a shop's own partner becomes unavailable mid-order, the order can be handed to a YuGo partner before pickup

9.6.6 Billing & POS

- ✓ GST-compliant invoice auto-generated for every order — online or walk-in
- ✓ Offline/online POS status stays in sync with the barcode-scan toggle from Inventory
- ✓ Daily billing summary for reconciliation at close

9.6.7 Discounts & Marketing

- ✓ Product-level or store-wide percentage/flat discounts
- ✓ Coupon codes for repeat or first-time customers
- ✓ Paid promotion: sponsored placement for the store, specific products, active discounts, or festival campaigns — part of YuGo's advertising marketplace

9.6.8 Reports & Business Dashboard

- ✓ Revenue parameters and trend graphs — daily, weekly, monthly views
- ✓ Exportable reports in CSV, Excel or PDF
- ✓ Analytics: top-selling products, peak ordering hours, repeat-customer rate

9.6.9 Employees & Shop Settings

- ✓ Add staff logins with limited permissions (e.g. order handling only, no financial access)
- ✓ Edit shop profile — images, timings, self-delivery flag, xerox flag — at any time
- ✓ Locked fields: Company Name and GST Number cannot be self-edited once verified; changes go through support
- ✓ Notification preferences for order alerts, low-stock warnings and payout updates

9.7 Revenue & Commission Model

The Shopkeeper Portal is where YuGo's platform revenue is realised on the merchant side. Three revenue streams touch the shopkeeper directly:

Stream	How it works
Merchant Commission	A commission or margin on every successfully completed order, deducted at settlement
Merchant SaaS Subscription	Optional monthly subscription unlocking premium tools — advanced reports, analytics, customer database, employee management
Advertising Platform	Shops pay for sponsored placement of their store, products, discounts or festival campaigns

9.8 Integrations & Third-Party Services

Service	Provider	Purpose
Payment Gateway	Razorpay / UPI	Order payments and merchant settlement payouts
Maps & Location	Google Maps SDK	Shop location pin, delivery radius, live tracking view
Identity & GST OCR	AWS Textract / Hyperverge	Automated reading and verification of GST & shop documents
Push Notifications	Firebase (FCM)	New order alerts, status updates, low-stock warnings
SMS / Email	Twilio / SES-class provider	OTP delivery, order confirmations, payout receipts

Barcode Scanning	Device camera + ML Kit / ZXing	Product lookup and POS online/offline toggling
------------------	--------------------------------	--

9.9 Exception & Edge Case Handling

A shop counter is a messy real-world environment — the portal has to degrade gracefully rather than block the shopkeeper.

Scenario	Handling
Order rejected or timed out	If a shop doesn't respond within the accept window, the order is automatically reassigned to the nearest shop carrying the same category — the customer never sees a dead end
Stock mismatch at fulfilment	An item shows available in-app but is out of stock on the shelf: the shopkeeper can partially fulfil the order, and the affected line is refunded automatically
Network drop mid-update	Status updates are cached locally on the device and synced automatically once connectivity returns — no update is lost
GST / document rejected during onboarding	The rejection reason is specific (e.g. "blurry image") and only the flagged document needs re-upload
Self-delivery partner unavailable	The shop can switch an order to a YuGo delivery partner any time before pickup, without cancelling the order

9.10 Technology Stack

Consistent with the platform-wide confirmed stack — see Section 14.1.

Layer	Technology
Web Portal (primary)	React + Tailwind CSS — desktop/laptop dashboard for shop owners
Companion Mobile App	React Native — lightweight order-acceptance & alerts on the go
Backend	Node.js + Express.js
Database	MySQL

The original module draft additionally proposed TypeScript for this portal's frontend — not included in the confirmed stack above; worth a team decision if type safety on shared order/RBAC data structures becomes a pain point later.

9.11 Team Execution Plan — Shopkeeper Module

Weeks	Focus	Deliverables
Week 1–3 (by 7 Aug)	Planning, Role Assignment & Frontend	Logo in multiple formats & vector; business-model parameters for the Shopkeeper portal; full Shopkeeper user journey end-to-end with validation; portal wireframes
Week 4	Parameters (maths)	Commission %, delivery-fee split and payout formulas for the Shopkeeper role
Week 5	Database Design	Schema for shops, products, inventory and orders
Week 6–8	Backend API	Shopkeeper-facing endpoints: catalogue, orders, inventory, reports
Week 9–10	Testing & Bug Fixes	End-to-end QA of onboarding, catalogue, order and delivery flows

9.12 Success Metrics (Merchant KPIs)

- ✓ Active Merchants
- ✓ Daily Orders per Shop
- ✓ Merchant Retention Rate
- ✓ SaaS Subscription Adoption
- ✓ Advertisement Revenue per Shop

PART D • DELIVERY PARTNER APP

10. Delivery Partner App PRD

MODULE

The Operational Node — Delivery Partner App (React Native)

YuGo aims to create a hyper-efficient, transparent, and rewarding delivery ecosystem. The Delivery Partner App is the critical node connecting the Assignment Engine with on-ground execution — it's the only YuGo app that physically moves between a shop and a customer's door. It must be highly responsive, battery-efficient, and easy to use in outdoor, high-stress environments.

10.1 Business Objectives

Objective	Target
Minimize friction	Onboarding takes less than 10 minutes
Maximize efficiency	Accurate routing to reduce delivery times by 15%
Partner satisfaction	Absolute transparency in earnings, incentives, and penalties
Reliability	99.9% uptime with robust offline syncing capabilities

The app relies on a synchronous triad — **Customer App (Demands)** ↔ **YuGo Backend (Engine)** ↔ **Partner App (Fulfilis)** — and does not exist in isolation from the other three surfaces.

10.2 Delivery Partner Types

YuGo supports two distinct operational models from day one, in the same app, to maximize coverage and flexibility.

Attribute	General Partner	Merchant Partner
Definition	Freelance gig-workers fulfilling orders across multiple vendors	Dedicated personnel employed by a specific high-volume merchant
Who's in charge	Super Admin / Region Head	The Shopkeeper who hired them
Orders come from	Any shop in their assigned region	Only that one shop's orders
Assignment logic	Geospatial proximity, batching algorithms, rider rating	Locked to a specific vendor ID
What they need to sign up	Aadhaar, PAN, driving licence, vehicle RC, bank details — full verification	Aadhaar, name, phone — lighter check since the shop vouches for them
Payout structure	Distance + Base + Time + Surge, handled by YuGo Wallet	Fixed salary or custom vendor agreement, handled by Merchant
UI differences	Full YuGo branding, map-centric view, active earnings tracker	Merchant-cobranding, list-centric view (less discovery needed)

Simple way to remember it: a General Partner works for YuGo. A Merchant Partner works for one shop, and just happens to use the YuGo app to do it.

10.3 Onboarding & Verification Flow

A strictly enforced, yet frictionless funnel to ensure compliance and security. General Partners go through a full ID check before going live; Merchant Partners get a shortcut because the shop that hires them is already verified.

Fig. 10.1 — Delivery partner onboarding flow: General vs. Merchant Partner

10.3.1 Step-by-Step Flow

1. **Authentication:** phone number input → Firebase OTP → token generation
2. **Profile Selection:** choose Two-Wheeler, EV, or Bicycle; choose Partner Type (skipped automatically if the rider arrived via a Shopkeeper's invite link)
3. **Document Upload (OCR Integration):** Aadhaar/National ID (front & back), Driving Licence (if motorized), Vehicle Registration (RC), and live selfie verification with liveness detection
4. **Background Verification:** app enters an "Under Review" state; background tasks poll GET /partner/verification-status for updates
5. **Activation:** once approved, the dashboard unlocks and the user receives a welcome push notification

Exception handling — document rejected: a specific API flag returns the reason (e.g. "blurry image"); the UI prompts the user to re-upload only the rejected document.

10.4 Core Screens & UI Specifications

10.4.1 Home Screen (Dashboard)

The central hub for active partners.

- ✓ Header: Status Toggle (Online/Offline), current location text
- ✓ Metrics card: Today's Earnings (₹), Total Trips, Time Online
- ✓ Heatmap: Google Map integration showing high-demand zones (surge-pricing areas highlighted)
- ✓ APIs used: POST /partner/status, GET /demand/heatmap

10.4.2 Incoming Order Overlay

High-priority modal interrupting the screen when the Engine assigns an order.

- ✓ Flashing borders, loud distinct ringtone (overrides silent mode if permission granted)
- ✓ Data shown: pickup location & distance, drop location area, estimated earning range
- ✓ Actions: swipe to accept, button to reject — with a 15-second countdown timer

10.4.3 Active Order — Pickup & Delivery

State	UI / Action
Reaching Pickup	Navigation to the shop; button: "Reached Store"
At Pickup	Order details (items, order ID); button: "Confirm Pickup" (requires photo of all items together — pickup photo is mandatory before moving forward)
Reaching Drop	UI switches to customer address; button: "Reached Location"
Delivery	OTP input; button: "Mark Delivered"

10.4.4 Full Screen Inventory

#	Screen	What it's for	Phase
1–5	Splash, OTP, Mode Selection, Documents, Verification	Getting a new partner signed up	0
6	Home / Availability	Online/offline switch, today's snapshot	0
7	Incoming Order Request	Accept or decline a new order, on a timer	0
8–10	Pickup, In-Transit, Delivery/OTP	The actual delivery, step by step	0
11	Order History	Past orders, searchable and filterable	1
12	Multi-Order Queue	Batched pickups and drops on one optimized route	2
13	Earnings Dashboard	Today/week/month, incentives, penalties	1
14	Wallet / Payout	Balance, withdrawal, bank details	1
15	Profile	Personal, vehicle and document management	0
16	Ratings & Feedback	What customers said after delivery	1
17	Support / Help	Raise a ticket, call support, FAQs	1
18	Notifications	Broadcasts from Admin / Region Head	1

10.5 Order State Machine & Lifecycle

The app relies on a strict state machine to prevent desynchronization between the partner, the customer, and the backend. Build the app so this sequence is impossible to skip steps in.

Fig. 10.2 — Delivery partner order state machine

#	State	Notes
1	IDLE	Online & waiting. Location pings every 30 seconds to save battery.
2	ASSIGNED	Ringing — 15-second countdown to accept/reject
3	ACCEPTED	Moving to merchant. Pings every 5 seconds.
4	ARRIVED_AT_MERCHANT	—
5	ORDER_PICKED_UP	Moving to customer. Pings every 5 seconds. Turns on live tracking in the Customer app.
6	ARRIVED_AT_CUSTOMER	—
7	DELIVERED	OTP verified

If an order is cancelled by the customer, the state is forced back to IDLE via a high-priority FCM data message.

10.6 Earnings & Wallet Module

Earning components

- **Base Fare:** standard minimum payout per order
- **Distance Pay:** calculated per km, pickup to drop
- **Wait Time Pay:** compensates riders waiting >10 minutes at the shop
- **Surge Multiplier:** applied dynamically on demand/weather (e.g. 1.5x during rain)

Wallet features

- **Ledger view:** real-time history of all credits and debits
- **Payouts:** weekly automatic settlement, plus optional "Instant Cashout" for a small fee
- **Floating Cash:** tracks COD collected; if it exceeds ₹2,000 the app blocks new orders until the rider deposits it at a partner store or transfers via UPI

10.7 Integrations & Third-Party Services

Service	Provider	Purpose
Maps & Routing	Google Maps SDK	In-app turn-by-turn navigation, distance matrices, ETA calculations
Push Notifications	Firebase (FCM)	Order assignments, cancellation alerts, support messages

Crashlytics	Firebase	Real-time tracking of app crashes and non-fatal errors
Identity & OCR	AWS Textract / Hyperverge	Automated reading of Aadhaar/Licence during onboarding

10.8 Mobile Architecture (React Native)

Technical stack

- Framework: React Native (shared with the Customer App and Shopkeeper companion app)
- UI: React Native components themed to YuGo brand identity
- State management: Redux / Context, modelling order status as a strict enum matching the state machine in Section 10.5
- Networking: REST calls to the shared Node.js + Express.js backend

Background location & services

- Ongoing "YuGo is tracking your location" notification while a delivery is active, so Android does not suspend location updates mid-delivery
- Deferrable background tasks for uploading delivery-proof photos if the network drops mid drop-off

Open implementation question: reliable background location tracking on Android (surviving app backgrounding / OS kill) is the hardest technical requirement in this app, and React Native's JS layer cannot guarantee it alone — it will need a native module bridge for the foreground service and location updates. This needs a specific library/module decision with the team before Phase 1 build starts; not resolved in this document.

10.9 Exception & Edge Case Handling

Scenario	Flow
Customer Unavailable	Rider presses "Customer Unavailable" → 5-minute countdown → app forces at least two masked calls to the customer → if the timer expires, UI reveals "Return to Merchant" or "Dispose Item" per backend logic
Incorrect OTP	3 wrong attempts locks the OTP field for 1 minute and prompts the rider to verify the last 4 digits of the customer's phone number as a fallback
Network Deadzone at Delivery	App caches OTP verification locally on-device; once connectivity returns, the cached update syncs automatically to mark the order delivered on the server
Vehicle Breakdown	Rider triggers "SOS / Breakdown"; order is unassigned and immediately routed to the nearest alternative partner

10.10 Phase-wise Implementation Plan

Phase	Timeline	Deliverables
Phase 1: Foundation (MVP)	Weeks 1–4	Auth, basic Home Screen, order acceptance, hardcoded maps, status toggling
Phase 2: Core Loop	Weeks 5–8	Complete order lifecycle, OTP verification, real-time location syncing to backend

Phase 3: Wallet & Edge Cases	Weeks 9–12	Earnings tracker, background verification integration, Customer Unavailable flows, offline support
Phase 4: Polish & Scale	Weeks 13–14	React Native UI refinement (brand compliance), battery optimization, crash-reporting fixes

This maps onto the platform-wide rollout plan as: Phase 0 pilot ships the core loop (onboarding, online/offline toggle, accept/reject, pickup photo, OTP drop) for General Partners only, in one region; Phase 1 adds Merchant Partner type, order history, ratings, wallet/payout and notifications; Phase 2 adds the multi-order queue and a fuller incentive engine; Phase 3 adds AI-assisted route suggestions and fraud/anomaly flags.

PART E · SUPER ADMIN / ADMIN PORTAL

11. Super Admin & Admin Portal PRD

MODULE

Platform Control Center

The Super Admin Portal is the highest-privileged dashboard within the YuGo ecosystem, providing centralized control over platform operations, user management, merchants, deliveries, finances, regional performance, marketing campaigns, system configuration, analytics, and reports. The Admin Portal shares most of the same UI but operates entirely under Role-Based Access Control (RBAC).

11.1 Roles & RBAC Model

Super Admin — complete access

- Platform Management
- User Management
- Financial Management
- Merchant Approvals
- Delivery Configuration
- Region Management
- Marketing Management
- Reports & Analytics
- Audit Logs
- System Configuration

Admin — RBAC-limited

Example permissions: Customer Support, Merchant Support, Order Management, Refund Management, Delivery Monitoring, Customer/Shop Verification, Reports, Notifications.

Cannot access: Revenue Settings, Tax Configuration, Delivery Pricing Engine, Platform Charges, System Settings, Audit Logs, Permission Management.

11.2 Dashboard (/dashboard)

The dashboard provides a real-time overview of the entire platform via KPI cards grouped by domain.

Group	KPI Cards
Customer	Total Customers, Active Customers Today, New Customers, Repeat Customers, Customer Retention, Customer Growth %
Merchant	Total Shops, Active Shops, Newly Registered Shops, Pending Verification, Top Performing Shops, Low Performing Shops
Delivery	Online / Busy / Idle Delivery Partners, Orders Waiting for Pickup, Average Delivery Time, Successful/Failed Deliveries %
Orders	Orders Today, Live Orders, Scheduled Orders, Completed, Cancelled, Returned, Refund Requests
Revenue	Today's Revenue, Platform Commission, Delivery Charges, GST Collected, Discounts Given, Merchant Revenue, Average Order Value, GMV, Net Profit
Region	Active Regions, Top/Lowest Performing Regions, Region-wise Revenue, Region-wise Orders
System Health	API Status, Server Status, Database Status, Payment Gateway Status, SMS Gateway, Email Gateway, Notification Queue

Dashboard charts: Orders by Hour, Revenue Trend, Customer Growth, Merchant Growth, Delivery Success Rate, Category-wise Sales, Region-wise Revenue, Top Selling Products, Peak Ordering Time, Heatmap of Orders.

Global search spans Customer, Order, Shop, Delivery Partner, Region Head, Admin, Phone Number, Email, Order ID, and Shop ID.

11.3 Core Modules

11.3.1 Customers Module (/customers)

List columns

Customer ID, Name, Mobile, Email, Total Orders, Total Spending, Last Order, Region, Status, Registration Date

Filters

City, State, PIN Code, Region, Registration Date, Order Count, Total Spending, AOV, Rating, Active/Inactive, Blocked, Premium, Referral

Bulk actions

Block, Unblock, Delete, Export, Send Email/SMS/Push, Apply Coupon, Assign Tags

Customer Details (/customers/:id)

Personal details, addresses, wallet balance, referral details, device info, complete order timeline, analytics (favourite categories/shops/products, monthly spending trend), and actions (Block, Unblock, Reset Password, Send Coupon, Download Report).

11.3.2 Region Heads (/region-heads)

List view: Region, Region Head, Revenue, Orders, Shops, Delivery Partners, Customers, Performance Score — filterable by revenue, orders, region, state, active status and growth rate. Actions: View, Edit, Transfer Region, Disable, Send Notification, Download Report.

Region Details (/region-heads/:id): region map, totals (customers, shops, partners, orders), revenue, GMV, growth %, hourly orders, peak time, shop/delivery performance, category-wise revenue, and the full list of region resources (shops, customers, delivery partners, admins).

11.3.3 Shopkeepers (/shops)

List columns: Shop ID, Shop Name, Owner, Category, Rating, Orders, Revenue, Status. Filters: Category, Rating, Revenue, Orders, Delivery Type, Verification Status, Subscription Plan. Bulk actions: Approve, Reject, Block, Send Notification, Export.

Shop Details (/shops/:id): business/GST/owner details, store timings, delivery mode, categories; business analytics (revenue, orders, best-sellers, conversion rate, cancellation rate, average delivery time); product analytics (top products, out-of-stock, low inventory, expiring); financials (commission paid, pending settlement, wallet balance, payout history); actions (Suspend Shop, Change Commission, Approve Products, Download Reports).

11.3.4 Delivery Partners (/delivery-partners)

List columns: Partner ID, Name, Vehicle, Orders, Earnings, Rating, Acceptance Rate, Region. Filters: Region, Vehicle Type, Rating, Earnings, Delivery Success, Online Status. Bulk actions: Block, Assign Region, Send Notification, Export.

Partner Details (/delivery-partners/:id): personal/contact/vehicle/document/insurance details and verification status; performance (total/successful/failed deliveries, acceptance rate, cancellation rate, ratings); financials (total earnings, incentives, penalties, weekly/monthly earnings); live tracking (current location, active orders, delivery timeline).

11.3.5 Orders Module (/orders)

Filters: Status, Shop, Customer, Region, Category, Payment Method, Delivery Partner, Date, Time, Order Amount. Each order shows: complete timeline, live tracking replay, payment details, customer, shop, delivery partner, bill, tax, discounts, commission. Admin actions: Assign Delivery Partner, Cancel Order, Refund, Modify Charges, Update Status, Reopen Order.

11.3.6 Discounts & Offers (/discounts)

Supports multiple discount engines — Region Based, Category Based, Shop Based, Customer Based, Festival Offers, First Order, Referral, Product Based, Time Based / Happy Hours, Membership Discounts — each with conditions: Minimum Order, Maximum Discount, Usage Limit, Customer Type, PIN Code, Payment Method.

11.3.7 Delivery Rule Engine (/delivery-rules)

Configures the delivery pricing logic that the Delivery Partner App's earnings module reads from: Region-wise Pricing, Shop-wise Pricing, Category-wise Pricing, Distance Slabs, Peak Hour Charges, Rain Charges, Festival Charges, Small Order Fee, Surge Pricing, Free Delivery Rules, Delivery Radius, Delivery Time Slots.

11.3.8 Financial Management (/finance)

Dashboard: GMV, Commission, GST, Delivery Revenue, Discounts, Refunds, Wallet Transactions, Merchant Settlements, Delivery Payouts. Reports: Daily, Weekly, Monthly, Quarterly, Annual.

11.3.9 Marketing (/marketing)

Create: Push Notifications, Email Campaigns, SMS Campaigns, Coupons, Referral Campaigns, Banner Promotions, Popups — with audience selection by Region, Customer Spending, Shop Category, Last Order, New Users, Premium Users.

11.3.10 Reports Center (/reports)

Every module supports downloadable reports (Excel, CSV, PDF): Customer, Merchant, Delivery, Revenue, GST, Region, Order, Product, Inventory, Coupon, Refund, and Commission Reports. A Report Builder lets admins choose columns, filters, date range, grouping and sorting, and schedule automatic generation.

11.3.11 Notifications Center

Send Push, Email, SMS, and (future) WhatsApp — with templates, rich text, variables, scheduling, and target audience selection, plus delivery reports.

11.3.12 Audit Logs

Every admin activity is recorded — logins, status changes, delivery-charge modifications, customer deletions, commission updates, coupon creation, delivery-rule edits — with fields for User, Time, IP Address, Device, Before Value, and After Value.

11.3.13 Role & Permission Management

Super Admin can create custom roles — Finance Admin, Customer Support, Merchant Support, Operations Manager, Marketing Manager, Region Manager, Analytics Manager — with granular permission levels: View, Create, Update, Delete, Export, Approve, Reject, Configure.

11.3.14 System Configuration (Super Admin only)

GST Settings, Platform Commission, Delivery Charges, Payment Gateway, SMS Provider, Email Provider, Wallet Settings, Refund Rules, Cancellation Policy, Order Timeout, Region Configuration, Category Management, Feature Flags, App Version Management, Maintenance Mode.

11.4 Future AI Features (Phase 3)

As YuGo evolves into a complete operating system for local businesses, the Super Admin Portal can include AI-driven operational insights and automation:

- ✓ AI Business Health Score for every shop
- ✓ Revenue forecasting
- ✓ Demand prediction by region
- ✓ Delivery demand heatmaps
- ✓ Fraud detection
- ✓ Customer churn prediction
- ✓ Smart pricing recommendations
- ✓ AI-generated operational reports
- ✓ Automated anomaly detection
- ✓ Intelligent support ticket routing

The Super Admin/Admin Portal is one of the core Phase 1 portals alongside Customer, Shopkeeper, Delivery Partner, and Region Head, before expanding into advanced analytics and SaaS capabilities in later phases.

PART F · CROSS-CUTTING SYSTEMS

12. Cross-App Integration & Data Flow

This is the part that matters most for building any one YuGo app without breaking the other three. Every row in the tables below is a promise one app makes to another, mediated by the shared Assignment Engine.

Fig. 12.1 — Cross-app event and data flow

12.1 Delivery Partner App ↔ Customer App

Something happens in the Delivery Partner App	What the customer sees
Order accepted	"Delivery partner assigned" + rider's name and phone
Location updates while online	Live map marker moves on the tracking screen
Status becomes "Out for Delivery"	The OTP screen switches on
Status becomes "Delivered"	Order marked complete, rating prompt appears

12.2 Shopkeeper Portal ↔ Delivery Partner App

Something happens in the Shopkeeper App	What happens in the Delivery Partner App
Shopkeeper marks order "Ready for Pickup"	Order is pushed to the nearest available partner
Shopkeeper chooses self-delivery	Order skips the general partner pool entirely — goes to that shop's own Merchant Partner
Shopkeeper adds a rider's phone number	Triggers the invite/claim flow for a new Merchant Partner
Shopkeeper edits the order after pickup started	Partner sees an updated bill / a change flag mid-delivery

12.3 Delivery Partner App ↔ Super Admin / Admin Portal

Almost everything the Admin Portal shows about delivery partners is really just data the Delivery Partner App produces.

What the Admin Portal shows	Where it comes from
Partner ID, Name, Vehicle, Region	Onboarding data
Orders, Earnings, Rating, Acceptance Rate	Computed from the order lifecycle events
Online / Busy / Idle status	The availability toggle + active order state
Live Location / Delivery Timeline	The same location-ping stream shown on the in-app map
Documents / Verification	Onboarding uploads
Block / Assign Region / Send Notification	Directly switches the app's access, region filter, or Notifications screen
Total Earnings / Incentives / Penalties	The Earnings Dashboard's ledger
Audit Logs	Every status change, logged with who / when / before / after

12.4 Region Head Visibility

Region Heads see the same performance data as Super Admin, scoped to their own region only.

12.5 Shared Data Contracts

DeliveryPartner

id · name · phone · email · partnerType (General/Merchant) · linkedShopId · vehicleType · KYC docs · bank details · regionId · verificationStatus · availabilityStatus · currentLocation · rating · acceptanceRate · walletBalance

DeliveryOrder

orderId · shopId · customerId · status (Assigned → Reached Pickup → Picked Up → Out for Delivery → Reached Drop → Delivered / Returned / Cancelled) · pickupPhotoUrls · deliveryOtp + attempts · isCOD + amountToCollect · earnings breakdown · timestamps per status change

EarningsLedger

partnerId · orderId (blank for bonus/penalty-only entries) · type (Order / Incentive / Penalty / Payout) · amount · reason · createdAt

Naming discipline: keep these three record type names identical across every team's codebase — Customer, Shopkeeper, Delivery Partner and Admin — so nothing gets lost in translation between apps. Location pings especially must share one payload shape from day one, since the same stream feeds the Customer app's map *and* the Admin Portal's live-tracking replay. The earnings ledger is the single source of truth and must reconcile 1:1 with the Admin Finance module — never let them diverge.

13. Revenue Model — Consolidated View

All four revenue streams originate from activity inside the Shopkeeper Portal and the order flow between Customer and Delivery Partner apps, and roll up into total platform revenue tracked in the Admin Portal's Finance module.

Fig. 13.1 — Revenue model: how order and shop activity becomes platform revenue

Stream	Mechanism	Realised in
Merchant Commission	% of every completed order, deducted at settlement	Shopkeeper Portal payouts, Admin Finance dashboard
Delivery Charges	Distance + order value + peak-hour/rain/festival pricing, plus a small-order fee	Customer checkout, Delivery Rule Engine (Admin)
Merchant SaaS Subscription	Monthly fee for premium tools — advanced reports, analytics, customer database, employee management	Shopkeeper Portal (Phase 3)
Advertising Platform	Sponsored placement of stores, products, discounts and festival campaigns	Shopkeeper Marketing module + Admin Marketing module

Top-line business metrics tracked against this model: **Gross Merchandise Value (GMV)**, Revenue, Commission Income, Subscription Revenue, Advertising Revenue, Contribution Margin, and — long term — EBITDA.

14. Non-Functional & Technology Requirements

14.1 Platform-Wide Technology Stack

Confirmed stack across all four apps: **React, React Native, Node.js, Express.js, and MySQL**. The same five technologies are used consistently rather than introducing a different language or framework per app.

Layer	Technology	Applies to
Web Frontend	React + Tailwind CSS	Shopkeeper Portal, Super Admin / Admin Portal
Mobile Apps	React Native	Customer App, Shopkeeper companion app, Delivery Partner App
Backend	Node.js + Express.js	Shared backend / Assignment Engine, common REST API for all four apps
Database	MySQL	Platform-wide

One React Native codebase, three consumers: Customer App, Shopkeeper companion app, and Delivery Partner App all build on React Native, so navigation patterns, API client code, and shared UI components can realistically be reused across all three rather than rebuilt per app. The Delivery Partner App's background-location requirement (Section 10.8) is the one place this stack needs a native module bridge — worth scoping with the team as a specific library/module decision before Phase 1 build starts, rather than assuming plain React Native APIs cover it.

Flagged, not decided: the original Shopkeeper Portal source spec additionally proposed TypeScript for that portal's web frontend. This master PRD keeps the confirmed stack to React, React Native, Node.js, Express.js and MySQL only, per team decision — TypeScript, Redis, Socket.io, and object storage (e.g. for images/KYC documents) are flagged here as things worth a deliberate decision later, not included in the stack above unless confirmed.

14.2 Shared Third-Party Services

Service	Provider	Used by
Payment Gateway	Razorpay / UPI	Customer checkout, Shopkeeper settlements, Delivery payouts
Maps & Location	Google Maps SDK	Customer tracking, Shopkeeper delivery radius, Delivery Partner navigation, Admin tracking replay
Identity & OCR	AWS Textract / Hyperverge	Shopkeeper GST verification, Delivery Partner KYC
Push Notifications	Firebase (FCM)	All four apps
SMS / Email	Twilio / SES-class provider	OTP, order confirmations, payout receipts, platform-wide
Crash Reporting	Firebase Crashlytics	Delivery Partner App (extendable platform-wide)
Barcode Scanning	ML Kit / ZXing	Shopkeeper Portal inventory

14.3 Non-Functional Requirements

Requirement	Target
Availability	99.9% target uptime across customer-facing and delivery-partner services
Performance	Home screen loads within 2 seconds; search responds within 1 second
Security	HTTPS everywhere, encrypted communication, secure payment gateway, OTP authentication, secure session management
Scalability	Architecture supporting millions of customer users and thousands of concurrent merchants/partners
Offline resilience	Local caching + background sync for Shopkeeper status updates and Delivery Partner OTP/location in network deadzones
Battery efficiency	Delivery Partner App: adaptive location-ping frequency (30s idle / 5s active) to conserve battery
Auditability	Every admin action logged with user, time, IP, device, before/after values

15. Consolidated Success Metrics & KPIs

Every module PRD defines its own KPIs; this section rolls them up by domain so the Admin dashboard (Section 11.2) has one coherent metric taxonomy to build against.

Customer Metrics

- Monthly / Daily Active Users (MAU/DAU)
- Repeat Order Rate
- Average Order Value (AOV)
- Customer Retention
- Checkout Conversion Rate
- Delivery Time

Delivery Metrics

- Average Delivery Time
- On-Time Delivery %
- Delivery Cost per Order
- Partner Acceptance Rate
- Successful / Failed Delivery %

Merchant Metrics

- Active Merchants
- Daily Orders per Shop
- Merchant Retention Rate
- SaaS Subscription Adoption
- Advertisement Revenue per Shop

Business Metrics

- Gross Merchandise Value (GMV)
- Revenue / Commission Income
- Subscription & Advertising Revenue
- Contribution Margin
- EBITDA (long term)

Long-term goal: become India's largest hyperlocal commerce platform and the default operating system for neighbourhood businesses — enabling millions of merchants to digitize their operations while giving customers seamless access to everything available around them.

16. Team Structure & Execution Timeline

16.1 Module Ownership

Owner	Module
Ravindra	Shopkeeper Portal (+ logo design in multiple formats & vector)
Arvind	Delivery Partner App
Hemanshu	Super Admin / Admin Portal, Region Head
Ankur	Customer Platform

16.2 Week-by-Week Plan

Weeks	Focus	Deliverables
Week 1-3 (deadline 7 Aug)	Planning, Role Assignment & Frontend	Theme & logo design (font size, family, colour) in multiple formats and vector; business-model documentation including all parameters/calculations for each portal; every user role's journey end-to-end across delivery modes, with validation; portal wireframes for all four apps
Week 4	Parameters (maths)	Numeric parameters for each role — commission %, delivery-fee splits, payout formulas
Week 5	Database Design	Schema design across shops, products, inventory, orders, partners and customers
Week 6-8	Backend API	Start backend API development against the shared Node.js + Express.js + MySQL stack
Week 9-10	Testing & Bug Fixes	End-to-end QA across onboarding, catalogue, order and delivery flows for all four apps

16.3 Business Rollout Milestones

The engineering timeline above feeds directly into the go-to-market milestones defined in Section 7: Phase 0 pilot targets **1 October**, Phase 1 initial market launch targets **1 January**, with Phase 2 and Phase 3 following as the merchant and partner base scales.

17. Risks, Open Questions & Assumptions

17.1 Open Questions to Settle With the Team

Delivery partner verification ownership

Who verifies Merchant Partners — the Shopkeeper alone, or does Region Head/Admin retain override power? The source documents assign merchant onboarding to Region Heads but don't specify who signs off on new delivery partners in a region.

Tipping

Does tipping exist at launch, or is it a Phase 2+ feature for the Delivery Partner earnings module?

Surge/peak charge transparency

Do delivery partners see a live breakdown of surge/peak charges per order, or only in the weekly earnings summary?

Self-delivery location tracking

For Merchant Partners on self-delivery, does the Delivery Partner App track their location at all — or does the Shopkeeper app own that leg of tracking entirely?

Failed-delivery policy

How many delivery attempts before an order is returned to the shop, and who absorbs the return-trip cost?

17.2 Known Product Risks

Risk	Notes
POS / billing system synchronisation	Merchants already running their own billing or POS system are the primary Phase 1 onboarding challenge — the portal needs an integration path rather than forcing immediate migration, called out independently in both the Business Model doc and the Shopkeeper Portal PRD.
Regulated categories excluded at launch	Pharmacies and unlicensed street-food vendors are excluded through Phase 1 pending compliance workflows — scope creep here would delay launch.
Two-sided marketplace cold start	Customer demand, merchant supply and delivery partner capacity all need to reach a workable density simultaneously within each new PIN code.
Location payload consistency	The Delivery Partner App's location-ping stream feeds both the Customer app's live map and the Admin Portal's tracking replay — any schema drift between these breaks two surfaces at once.
Earnings ledger divergence	The Delivery Partner wallet must reconcile 1:1 with the Admin Finance module at all times; treat this as a single source of truth, not two systems to keep in sync.

17.3 Assumptions

- ✓ All four apps share one backend and one Assignment Engine — no module is designed to operate against a forked or delayed copy of shared data

- ✓ Region Heads are hired ahead of merchant onboarding in each new region, not after
- ✓ Merchants have smartphone or laptop access sufficient to run a web-based dashboard
- ✓ Delivery partner supply (both General and Merchant types) is available in every PIN code before that PIN code goes live to customers

18. Appendix — Glossary

Term	Definition
Assignment Engine	The shared backend logic that matches orders to delivery partners and keeps all four apps synchronized
GMV	Gross Merchandise Value — total value of goods sold through the platform
AOV	Average Order Value
MAU / DAU	Monthly / Daily Active Users
RBAC	Role-Based Access Control — permission model used by the Admin Portal
OTP	One-Time Password — used for login and delivery confirmation
KYC	Know Your Customer — identity verification for delivery partners
COD	Cash on Delivery
SaaS	Software as a Service — the merchant subscription tier of the business model
General Partner	A delivery partner managed by YuGo, fulfilling orders across multiple shops in a region
Merchant Partner	A delivery partner employed by and locked to a single shop
Region Head	Local manager responsible for merchant onboarding and regional operations
PIN Code	Postal code — the unit by which YuGo's geographic rollout is phased
Floating Cash	COD cash a delivery partner is currently holding, capped before new orders are blocked

[YuGo — Why Go Out?](#) · [End of Master PRD](#) · [Confidential & Proprietary](#)
